BOUNDARY STONES

Official Limits of District Have Been Subject for Scientific Surveys Since Original Ceremony.

By I. John G. History, Practitioner.

The original surveyors and the early surveyors of the District have received much credit for their work, as they were men who were skilled in the art of surveying, and who were able to make accurate and detailed maps of the area. The early surveyors were responsible for the creation of the original boundary lines, which were used as the basis for the development of the District.

The surveyors were often hired by the government to perform this work, and they would often work with a team of assistants to help with the measuring and marking of the boundary lines. The surveyors would use a variety of tools, such as compasses, chains, and leveling instruments, to accurately measure and mark the boundaries.

The surveyors would often work in difficult and remote areas, and they would have to navigate through rough terrain in order to complete their work. Despite the challenges, the surveyors were able to complete their work with a high degree of accuracy, and their maps and surveys are still used today as a reference for the boundaries of the District.

The surveyors would often work for many years on a single project, and they would often have to work in all kinds of weather, from hot and sunny days to cold and rainy days. Despite the challenges, the surveyors were able to complete their work with a high degree of accuracy, and their maps and surveys are still used today as a reference for the boundaries of the District.
